

# Powering Up The Future

## Part 2

My idea for something to save energy is by making solar panels last longer, this can be done by adding more double glazed glass to the panels in hotter areas for them to not die as fast. We already use double glazed glass in normal solar panels but its not enough to block out as much heat, if we use more in the areas that need it most, it can expand the lifespan of the panels by years, saving more energy and money. The advancement of this technology could help us stop using as much coal and fossil fuel, driving us to use energy while still saving it.
